

Coughing,
sneezing,
runny nose,
fever—
flu?

**It
could
be
RSV**

Respiratory Syncytial Virus (RSV) is a widespread virus that may cause serious lung infection

RSV is a common virus

Almost all children catch RSV at least once by the time they turn 2. It is easily spread by sneezing, coughing, or physical contact (such as kissing, touching, or hugging). Like the flu, RSV outbreaks are seasonal. In most parts of the United States, RSV season runs from fall into spring.

Severe RSV disease is the #1 cause of hospitalizations in babies under a year old in the United States

In most healthy babies, RSV infection usually causes mild to moderate cold-like symptoms. However, in certain high-risk infants, RSV can lead to serious lung infection.

Your baby may be at high risk for RSV disease

Talk to your doctor if your baby:

- Was born early (premature)
- Developed chronic lung disease
- Was born with heart disease

Ask your doctor or visit www.RSVprotection.com for more information about how to help protect your baby against RSV disease
